

Socioeconomic, Lifestyle, and Health-System Determinants of Kidney Failure in Nigeria: A Mixed-Methods Study

Test Author

Test University

Abstract

Kidney failure is a growing burden. Prior work on socioeconomic determinants remains insufficient in low-resource settings. This study synthesizes quantitative and qualitative evidence across Nigerian health systems.

Keywords: kidney failure; Nigeria; socioeconomic; mixed methods

Study area: Public health

Introduction

Chronic kidney disease progression to end-stage renal failure imposes substantial morbidity. We examine lifestyle, income, and facility-level factors.

Methodology

We conducted a mixed-methods review of peer-reviewed studies (2015-2025) and semi-structured interviews with clinicians (n=24).

Results / Analysis

Socioeconomic status and delayed referral were recurrent themes. Urban-rural disparities in dialysis access were pronounced.

Discussion

Policy should prioritize early screening and subsidized dialysis in underserved regions.

Conclusion

Integrated health-system reforms can mitigate the rising burden of kidney failure in Nigeria.
